

Climate Controllers from SKOV gain Ground in Asia

Through the sales office in Bangkok, SKOV has made agreement about supplying climate controllers to 450 broiler houses in Thailand

SKOV A/S in Denmark have made agreement about supplying climate controllers to 450 broiler houses on five poultry farms in Thailand. The houses will be equipped with DOL 339 climate computers providing optimum possibilities for regulation of the climate in the livestock house.

- This is our largest individual order in Thailand so far. It concerns the installation of our most advanced climate computer ventilating according to the Tunnel principle, says the sales manager responsible for Thailand Amnat Koenchai, SKOV A/S.

The installation will take place on five poultry farms which are in for renovation. The farms are owned by Leamthong, a private integration owning feed mills, breeder production, broiler production and slaughterhouses. Leamthong's products are sold both locally in Thailand and are exported to neighbouring countries. The integration has a production of approx. 1.5 million day-old chickens per week.

- We will be ready to install the first 44 climate controllers early in November provided that the rain does not delay the building project. The farm is situated in Nakhon Chaisi District, in the Nakhon Pathom province. The remaining climate computers - just over 400 - will be installed at the end of November/beginning of December on the four other poultry farms, says Amnat Koenchai.

- SKOV won the order because the owner saw the advantages of our way of controlling the climate. Great demands are made on the climate control in the livestock houses as regards correct setting of temperature, humidity and air velocity. It is important to have full control of these factors during the entire production cycle to have optimal utilization of the productivity of the broilers, Amnat Koenchai continues.

The other farms are situated in the provinces Nakhon Ratchasima and Saraburi.
