

Great overview on the small screen

The FarmOnline management program is introduced with two new modules. A broiler model that provides the producer with an overview of current production data and a Program Manager that controls and checks settings in climate and production controls at one or more farm(s). The two FarmOnline modules are introduced in connection with the exhibitions EuroTier in Germany and Agromek in Denmark, where they are an approved new product.

In poultry production worldwide it is crucial that the producer daily monitors many key figures in order to ensure optimum productivity. It is important that gain and consumption key figures are compared with expected figures, and that action is taken concerning any deviations. Productivity and the welfare of the animals are very dependent on the deviations being handled as quickly as possible.

– With the FarmOnline Broiler module, we have developed a completely new way of creating an overview of important key figures from the broiler production, says Kim Jensen Møller, Product Manager, SKOV A/S.

Central values such as feed conversion ratio (FCR) and production efficiency factor (PEF) are shown in a central display with status indicated by different colours. The actual values are continually compared with expected references and former batches. The product differs from competing products by providing an easily comprehensible overview of a large number of important key figures from the broiler production.

– We have made the entire screen display dynamic, and it is continually adapted to the production, so that it is possible to go back in time to analyse any deviations and compare with former batches in the same dynamic way, Kim Jensen Møller continues.

Overview of the house controls

The FarmOnline Management module helps the producer ensure that all house controls at all farms run with the planned settings and strategies. Deviations from the planned are shown clearly, and the producer can therefore make sure that the controls are set as expected.

– Today, house controls are as advanced as PCs. There are quite a lot of options and settings, and it may be difficult, for instance, to ascertain whether an employee has changed settings in the controls on their own initiative, says Kim Jensen Møller.

The module can also be used for uploading the same settings to all controls. In this way, the producer can establish his strategies and settings at the office and at the same time make sure that all house controls run with these settings.

– The new module also makes it possible to exchange strategies between various farms via the FarmOnline Enterprise module and to exchange strategies with consultants or SKOV, Kim Jensen Møller concludes.

In combination with the other monitoring and alarm functions in both FarmOnline and the house controls, the Program Manager module will improve the producer's efficiency and overview and at the same time increase security and the welfare of the animals.
